INTRODUCTION

Use this guide to replace a noisy worn-out fan.

TOOLS:

- [T6 Torx Screwdriver](#) (1)

PARTS:

- [Intel Mac mini \(Mid 2011-Late2012\) Fan](#) (1)

Step 1 — Bottom Cover

- Place your thumbs in the depressions cut into the bottom cover.
- Rotate the bottom cover counter-clockwise until the white dot painted on the bottom cover is aligned with the ring inscribed on the outer case.
- ⓘ You do not need to apply much downward pressure while turning.

Step 2

- Tilt the mini enough to allow the bottom cover to fall away from the outer case.
- Remove the bottom cover and set it aside.

Step 3 — Fan

- Remove the two 11.3 mm T6 Torx screws securing the fan to the logic board near the antenna plate.

Step 4

- Lift the ear of the fan nearest the RAM up off the standoff secured to the outer case.
- ⓘ Removing the standoff screw is not necessary to remove the fan. You need only raise the fan enough to lift it off the standoff screw.

Step 5

- Lift the fan out of the mini for enough clearance to access its connector.
- Grab all the wires at once and gently pull **straight up** to disconnect the fan from the logic board.
⚠ Do not pry at the socket, or you may rip it from the logic board.
- Remove the fan.
