

Installing iMac Intel 21.5" EMC 2389 Dual Drive

Use this guide to install a second hard drive or SSD in place of the optical drive.

Written By: Brittany McCrigler

INTRODUCTION

There are many benefits to adding a second drive to your iMac such as improved speeds, greater storage space, and less heartache when installing new software. Use this guide to install one using our optical bay drive enclosure.

TOOLS:

- [Heavy-Duty Suction Cups \(Pair\)](#) (1)
- [Phillips #00 Screwdriver](#) (1)
- [Spudger](#) (1)
- [T10 Torx Screwdriver](#) (1)

PARTS:

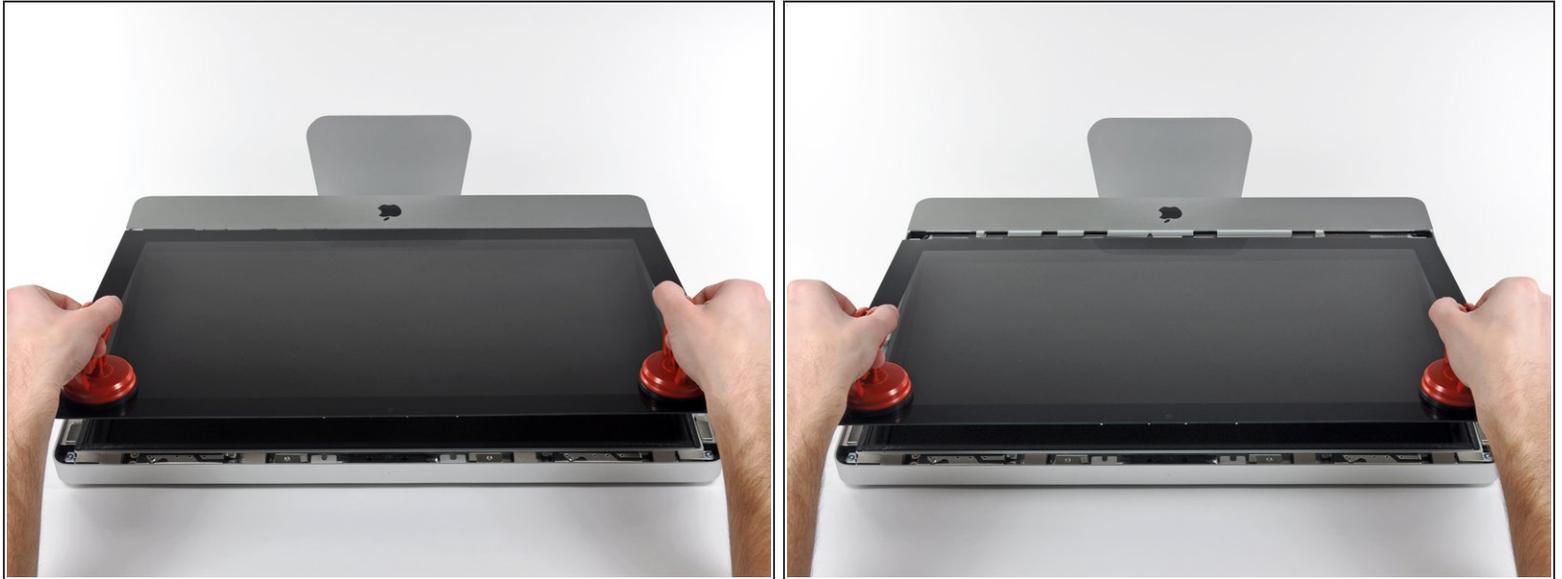

- [iMac & Mac mini Dual Drive Enclosure](#) (1)

Step 1 — Glass Panel

- ⓘ Before beginning, unplug your iMac and lay it on a soft surface as shown.
- Stick a suction cup near each of the two top corners of the glass panel.
- ⓘ To attach the [suction cups](#) we sell, first position the suction cup with the movable handle parallel to the face of the glass panel. While lightly holding the suction cup against the glass, raise the movable handle until it is parallel with the other handle.
- If your suction cups refuse to stick, try cleaning both the glass panel and the suction cup with a mild solvent.

Step 2

- Gently lift the glass panel perpendicular to the face of the LCD enough to clear the steel mounting pins attached along the underside of the top edge of the glass panel.
 - Pull the glass panel away from the lower edge of the iMac and carefully set it aside.
- During reinstallation, be sure to meticulously clean the inside of the glass panel and the face of the LCD as any dust or fingerprints trapped inside will be annoyingly visible when the machine is turned on.

Step 3 — Display

- Remove the eight 8 mm T10 Torx screws securing the display to the outer case.
- i** The last two pictures are detail shots of each side of the display.

Step 4

- Slightly lift the top edge of the display out of the outer case.

 Do not lift it too much. There are several cables attaching the display to the logic board.

Step 5

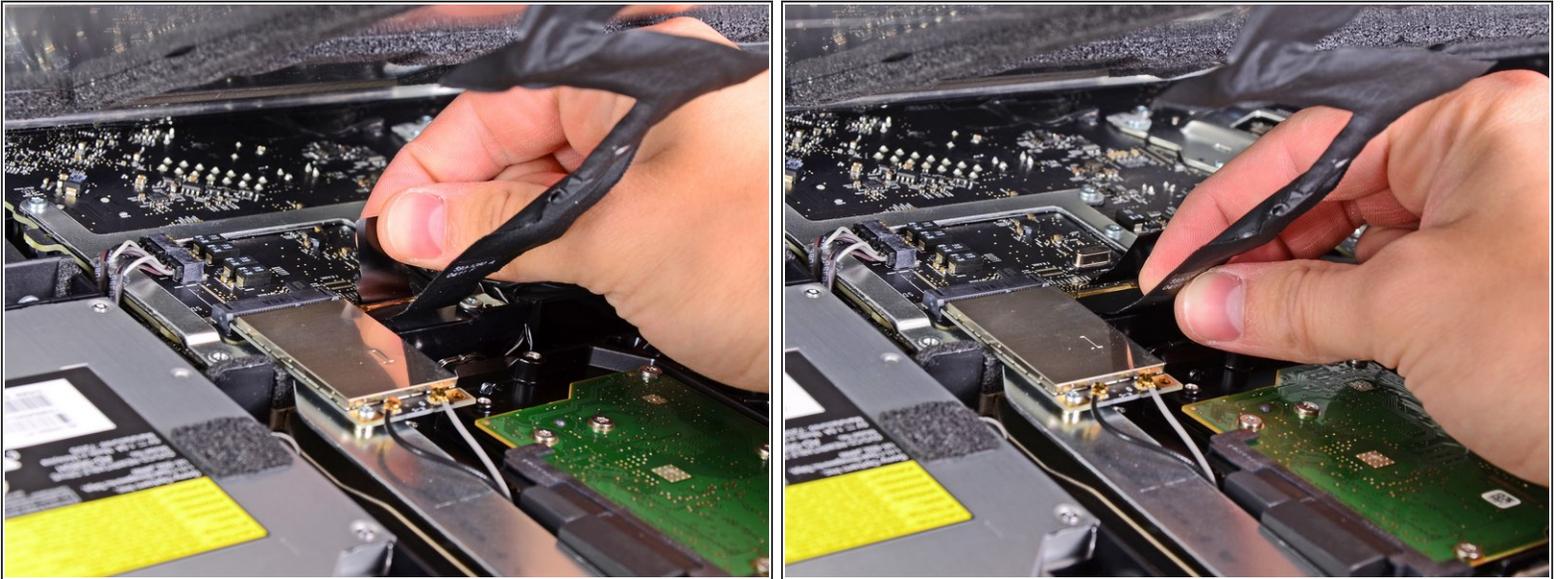

- Pull the vertical sync cable connector out of its socket on the LED driver board near the top left corner of your iMac.

Step 6

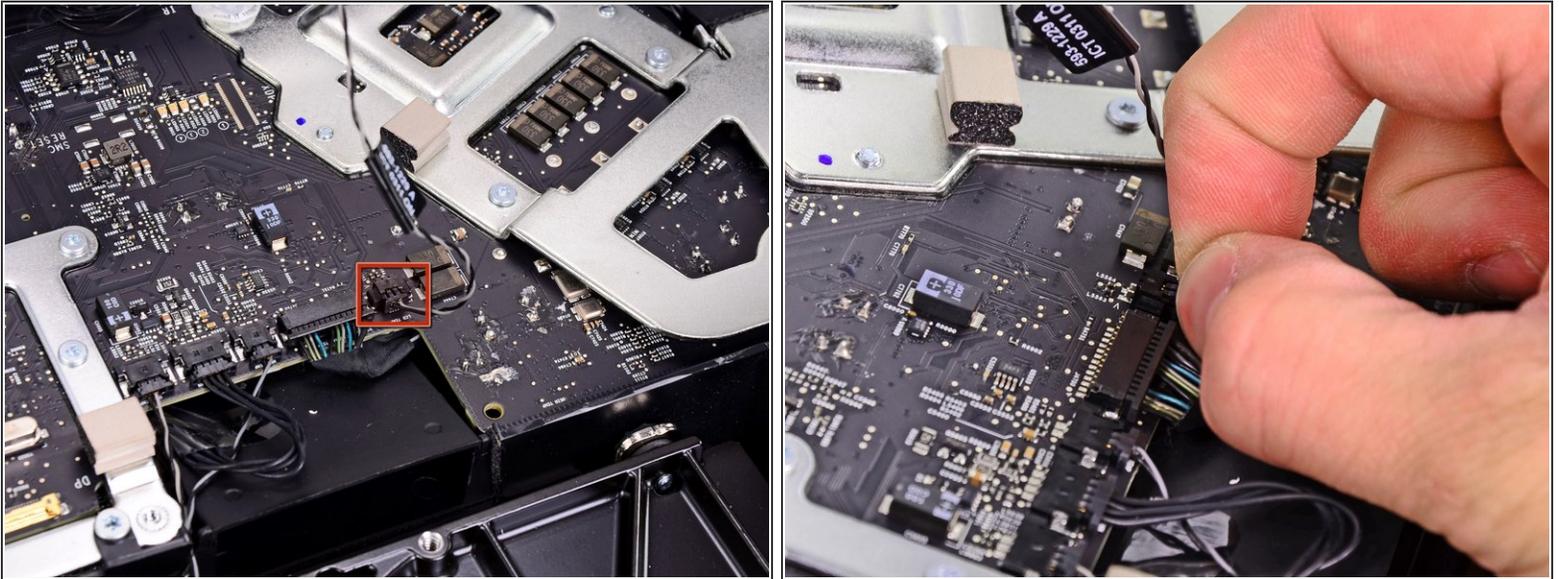

- Rotate the display out of the outer case enough to disconnect the LED backlight power cable from the LED driver board.
- ⓘ Disconnect the LED backlight power cable by depressing the locking mechanism while pulling the connector away from its socket (toward the bottom edge of the iMac).

Step 7

- ⚠ The display data cable plug has a wire lock. Disengage the plug's lock by rotating the plastic tab so that it points upward. (It is not a pull tab.)
- Pull the display data cable straight out of its socket on the logic board.
- ⚠ Do not lift up on the display data cable, as its socket is very fragile. Pull the cable parallel to the face of the logic board.

Step 8

- Disconnect the LCD thermal sensor cable connector from its socket on the logic board.
- ⓘ If your fan is spinning full speed after completion, check this connection or the hard drive's thermal sensor cable.

Step 9

- Carefully pull the display toward the top edge of your iMac and lift it out of the outer case, minding any cables that may get caught.

Step 10 — Optical Drive

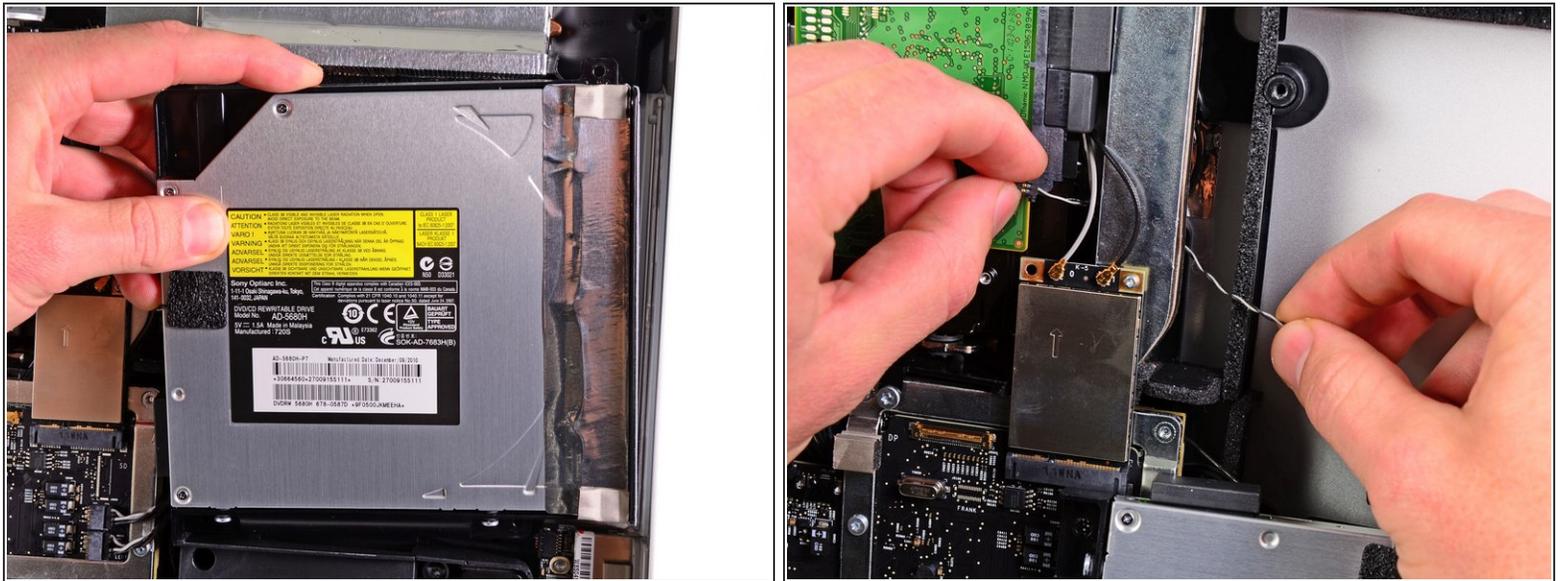

- Remove the following four screws:
 - One 9.3 mm T10 Torx screw with a large head
 - Three 9.3 mm T10 Torx screws with a normal sized head

Step 11

- Pull the optical drive thermal sensor connector toward the top edge of the iMac to disconnect it from its socket on the logic board.

Step 12

- Lift the inner edge of the optical drive and maneuver its connector past the GPU frame attached to the logic board.
- Carefully pull the optical drive off its mounting pins on the right side of the outer case to gain clearance for disconnecting the optical drive cable.
- Allow the optical drive to hang down as you de-route the optical drive thermal sensor connector from behind the GPU heat sink.

Step 13

- Disconnect the optical drive cable by pulling its connector away from the optical drive.
- Remove the optical drive from the iMac.
- ⓘ Do not forget to also move the thermal sensor from the optical drive to the enclosure when you install the second hard drive.

Step 14 — Optical Drive Enclosure Faceplate

- Remove the three 3.0 mm Phillips screws from the optical bay enclosure.

Step 15

- Starting from the left edge, gently pull open the optical bay enclosure.
- Continue to pull open the two halves of the enclosure until they separate.

Step 16

- Remove the two 3.0 mm Phillips screws securing the faceplate to the optical bay enclosure.

Step 17

- Lift the black plastic faceplate out of the optical bay enclosure.
 - ⓘ You will no longer need the faceplate or the two Phillips screws that held it in place. Set those parts aside if you ever wish to put the faceplate back into the enclosure.
- Reassemble the optical bay enclosure without the faceplate, reusing the original three 3.0 mm Phillips screws to keep it intact.

Step 18 — Dual Hard Drive

- Remove the plastic positioner from the optical bay hard drive enclosure by pressing in on one of the clips on either side and lifting it up and out of the enclosure.

Step 19

- Make sure that the hard drive connectors are facing down before placing it into the enclosure.
- Gently place the hard drive into the enclosure's hard drive slot.
- While firmly holding the enclosure in place with one hand, use your other hand to press the hard drive into the enclosure connectors.

Step 20

- Once the hard drive is snug, reinsert the plastic positioner while holding the hard drive against the bottom of the enclosure.
- Reconnect any cables you have removed from the original optical drive onto the optical bay enclosure.

To reassemble your device, follow these instructions in reverse order.
